"Identification of SATHES as the cleft palate gene on 2q32-q33.";

Hum. Mol. Genet. 12:2491-2501(2003).

-! FUNCTION: May play an important role in palate formation.

-! SUBCELPLULAR LOCATION: Nuclear (By similarity).

-! TISSUE SPECIFICITY: High expression in adult brain, moderate expression in fetal brain, and weak expression in adult liver,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bukaran Jaraman, Mandara, Craniata, Vertebrata, Buteleostomi,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Note-No experimental confirmation available;

Note-No experimental confirmation available;

Note-No Expression first detected at 10.5 dpc in the maxillary component of the first pharyngeal arch and the lateral aspect of the frontonasal process in the regions that will subsequently fuse to form the primary palate. At 11 - 11.5 dpc, the expression pattern demarcates the region of the medial aspect of the maxillary process within the primitive oral cavity, which will form the palate shelf. By 12.5 dpc, symmetrical expression is seen in the medial edges of the developing palate shelves and this continues until 13.5 dpc when the strongest expression is in the mesenchyme underlying the medial edge epithelia. By the time of palatal shelf fusion at 14.5 dpc the expression is dramatically down-regulated. No expression detected elsewhere in the embryo at any stage examined.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FUNCTION: Involved in nonsense-mediated decay of mRNAs containing premature stop codons. It interacts, via its C-terminus, with NAM7/UPF1. Could be involved in determining the efficiency of translational termination or reinitiation or factors involved in the initial assembly of an initiation- and termination-competent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lee S.I., Umen J.G., Varmus H.E.;

Nucleic Acids Res. 13:5283-5295(1985).
-!- FUNCTION: Precursor of the egg-yolk proteins that are sources of nutrients during embryonic development (Potential).
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Synthesized in Caenorhabditis only by 32 cell building the intestine of adult hermaphroditic individuals; they are cotranslationally secreted into the body cavity and subsequently taken up by the gonad.
-!- SIMILARITY: Contains 1 VWFD domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Eukaryota; Metazoa; Nematoda; Chromadorea; Rhabditida; Rhabditoidea;

Genet. 261:820-830(1999).
-!- FUNCTION: Binds to the 40S ribosome and promotes the binding of methionyl-tRNAi and mRNA.
-!- SUBJUNIT: eIF-3 is composed of at least 12 different subunits (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             30-MAY-2000 (Rel. 39, Created)

I woleic Acids Res. 13:5283-5295(1985).

I POWCINION: Precursor of the egg-yolk proteins that are sources of nutrients during embryonic development (Potential).

I SUBCELULAR LOCATION: Secreted.

I SUBCELULAR LOCATION: Secreted.

I TISSUB SPECIFICITY: Synthesized in Caenorhabditis only by 32 cells building the intestine of adult hermaphroditic individuals; they are cotranslationally secreted into the body cavity and subsequently taken up by the gonad.

I PPM: Vitellogenin 5 undergoes little if any processing before being packaged into yolk platelets.

                                                                                                                             plasma membrane.

SIMILARITY: THE ACTIN-BINDING DOWAIN IS OF A TYPE FOUND IN MA
ACTIN-BINDING PROTEINS (SUCH AS ACTININ, DYSTROPHIN, FIMBRIN,
ABP-120, ABP-180, OR BETA-FODRIN).

SIMILARITY: Contains 2 calponin-homology (CH) domains.
SIMILARITY: Contains 22 spectrin repeats.
SIMILARITY: Contains 1 WM domain.
SIMILARITY: Contains 1 WM domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ACTIN-BINDING.

TISSUE SPECIFICITY: Found in heart, muscle, liver and brain.
Most abundant in heart. Also detected in fetal tissues.
SIMILARITY: Belongs to the cation transport ATPases family (P-type ATPases). Subfamily IV.

Greenwell P.S., Kronmal S.L., Porter S.E., Gassenhuber J.,
Obermaler B., Petes T.D.,
Submitted (MAR-1997) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Putative phosphatidylinositol kinase involved controlling telomere length.
-!- SIMILARITY: Belongs to the Pl3/P14-kinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Obermaier B., Gassenhuber J., Piravandi E., Domdey H.; "Sequence analysis of a 78.6 kb segment of the left end of Saccharomyces cerevisiae chromosome II."; yeast 11:1103-1112(1995).
